

METHYLENE BLUE

Methylene Blue helps your cells make cleaner energy, protects your mitochondria, and reduces wear-and-tear from oxidative stress. This can support brain function, energy levels, and overall cellular repair when used appropriately under medical supervision.

1. Redox (oxidative stress) support

- Every cell makes “spark” chemicals (free radicals) when it burns fuel; too many of these damage cells.
- Methylene Blue acts like a tiny reusable wire that helps move those sparks in a safer way, so cells make energy with less “smoke” and less rusting (oxidative stress).

2. Mitochondria (cellular energy) support

- Mitochondria are the cell’s “batteries” or power plants.
- When those power plants are tired or damaged, methylene blue can give them a shortcut route to move electrons so they can keep making energy more efficiently, especially in high-demand tissues like the brain and muscles.

3. Cellular repair / protection

- When cells are under heavy stress (aging, poor blood flow, toxins, inflammation), they start to break down faster.
- By making energy production cleaner and steadier, Methylene Blue helps cells stay alive longer, repair themselves better, and resist damage in sensitive areas like the brain and nervous system.
