

STAFF TRAINING · CLIENT PRICING

The Pharmacy Selector

How to use our sourcing tool to price a client correctly, every time — and pick the right pharmacy between **Formulation Rx**, **BoomRx**, and **Olympia**.

This guide teaches you what the tool does, what every number means, and the exact steps to quote a client. Read it once, keep it at the front desk, and use the cheat sheet on the last page while you learn.

1 What this tool is — and when to use it

The **Pharmacy Selector** is our single source of truth for what a medication *costs us* and what we *charge the client*. We buy the same or similar compounds from three pharmacies, and their prices differ. This tool lines them up so you always quote from real numbers — never a guess.

Use it whenever you:

- Quote a client a price for a GLP-1, peptide, hormone, vitamin injection, or hair-loss product.
- Need to know which pharmacy is cheapest for a compound before we order.
- Are checking a client's cost for a 30-day vs a 90-day supply.

THE GOLDEN RULE

Never quote a client from memory. Open the tool, find the product, read the **Client** number. That's the price.

2 The three pharmacies at a glance

PHARMACY	THINK OF IT FOR...	NOTES
Formulation Rx	Our primary vendor — GLP-1s (Tirzepatide, Semaglutide), hormones, peptides, hair loss, wellness capsules	Most of what we order. Prices come from our portal.
BoomRx	Peptide therapy — BPC-157, TB-500, CJC/Ipamorelin blends, NAD+	Specialty peptide blends.
Olympia	Vitamin injections, IV-style blends, glutathione, B12, hormone creams	Wellness & vitamin menu.

3 The three numbers you must know

Every product shows three prices. Understand these and you understand the whole tool.

COLUMN	WHAT IT MEANS	WHO IT'S FOR
Cost	What <i>we</i> pay the pharmacy for the product.	Internal only — never shown to the client.
Client	What the <i>client</i> pays us. This is Cost × 2.5 .	This is the number you quote.
Margin	Our profit on the product = Client – Cost .	Internal — shows how much we make.

$$\text{Client} = \text{Cost} \times 2.5 \cdot \text{Margin} = \text{Client} - \text{Cost}$$

PLUS SHIPPING — ALWAYS

On top of the Client price, **the client pays a flat \$30 shipping** per order. Shipping is *not* included in the Client number or in Margin — add it when you total the order.

Example: A product with a \$70 Cost → Client is **\$175.00** (70×2.5). Client's total with shipping = **\$205.00**. Our margin = \$105.00.

4 30-day vs 90-day supply

At the top of the tool there's a **Supply** toggle: **30-day** or **90-day**. It changes every price on the screen at once.

- **30-day** shows the price for one standard vial / unit (most monthly protocols).
- **90-day** multiplies the vial quantity by 3 for a three-month supply — Cost, Client, and Margin all scale together.

IMPORTANT

90-day is a **3x estimate of the vial quantity** — it does *not* know a specific patient's dose. For GLP-1s and anything dose-dependent, confirm the actual dosing with the provider before you quote a 90-day total.

5 The two views

Compare by compound

Groups the *same* medication across all three pharmacies so you can see who's cheapest. **Start here when you know the product and want the best price.** Click any compound to expand every strength/size, sorted cheapest first.

Browse by pharmacy

Shows each pharmacy's full menu, grouped by category. **Use this to explore what one pharmacy offers**, or when a client asks "what do you have for...".

Above both views you also have a **Search** box (type a compound, strength, or SKU) and **category chips** (GLP-1 / Weight Loss, Hormone Therapy, Peptide Therapy, Wellness, Vitamin Injections, Hair Loss, Sexual Health) to narrow the list.

6 Reading the badges & flags

BADGE	MEANING
	This compound is carried by more than one pharmacy — worth comparing price.
	The lowest-cost option for that compound. Default to this unless a provider specifies a pharmacy.
	Controlled substance — extra handling/documentation rules apply.
	Ships cold / next-day only. Factor into timing when you set client expectations.
BUD	Beyond-Use Date window (e.g. 45-day, 60-day) — how long the compound is good once dispensed.

7 How to price a client — step by step

1 Open the tool and confirm the supply length.

Set the **Supply** toggle to 30-day or 90-day to match what the client is getting.

2 Find the product.

Stay in **Compare by compound** and search the compound name (e.g. "Tirzepatide"), or tap a category chip.

3 Expand and match the exact strength/size.

Click the compound to open all SKUs. Match the **strength and vial size** the provider ordered — not just the name.

4 Read the **Client** number.

That's the price the client pays for the product. The cheapest option is tagged  — use it unless the provider named a pharmacy.

5 Add \$30 shipping for the order total.

Client total = Client price + **\$30**. If they're buying multiple items, shipping is charged once per order.

6 Double-check the flags.

Note any  or  flags so you set the right expectations on paperwork and timing.

WORKED EXAMPLE

Client wants a **30-day Tirzepatide**. You search "Tirzepatide," expand it, and match the strength the provider ordered. The cheapest SKU shows Cost \$90 → **Client \$225.00**. You quote **\$225 + \$30 shipping = \$255.00**. Margin to us: \$135.00.

8 Golden rules & common mistakes

- **Match the strength, not just the name.** "Semaglutide" at one pharmacy may be a different concentration than another. The cheapest sticker price isn't always the same product — check the strength column.
- **Always add the \$30 shipping** to the client's order total. It is never inside the Client price.
- **Treat 90-day as an estimate** until dosing is confirmed by the provider.
- **Never show the client the Cost or Margin columns.** Those are internal. Quote the Client number only.
- **Verify before ordering.** Pricing can change — if something looks off, confirm with the pharmacy or a manager.
- **Follow medical & privacy rules.** No dosing advice, no outcome promises, and treat all client info as protected health information.

9 Knowledge check

Answer these before you price your first client solo. Answers at the bottom.

1. A product's Cost is \$60. What does the client pay for the product (before shipping)?

a) \$60 b) \$90 c) \$150 d) \$120

2. The client is buying one item with a \$140 Client price. What's their total out the door?

a) \$140 b) \$150 c) \$170 d) \$210

3. Two pharmacies carry the same compound at different prices. What should you check before quoting the cheaper one?

- a) Nothing — cheapest wins b) That the strength/size actually match c) The color of the badge

4. Which columns do you never show a client?

- a) Client b) Cost and Margin c) Strength

5. The 90-day price is best described as...

- a) An exact patient total b) A 3× vial estimate to confirm with the provider c) Always wrong

Answers: 1-c ($\$60 \times 2.5 = \150) · 2-c ($\$140 + \30 shipping) · 3-b · 4-b · 5-b

10 Quick reference — keep this at the desk

$$\text{Client} = \text{Cost} \times 2.5$$

$$\text{Client total} = \text{Client} + \$30 \text{ shipping}$$

DO	DON'T
Quote the Client number	Quote from memory
Match strength + size exactly	Match name only
Add \$30 shipping to the total	Forget shipping
Use the Cheapest -tagged option	Show Cost or Margin to clients
Confirm 90-day dosing with provider	Assume 90-day = exact

Fast pricing recipe

1. Set **Supply** (30 / 90-day).
2. **Search** the compound in Compare by compound.
3. **Expand** → match strength & size.
4. Read the **Client** price (use **Cheapest**).
5. Add **\$30 shipping** → that's the client total.
6. Check ⚠️ / ❄️ flags.

Prices in the tool: Formulation Rx from our portal · Olympia from the 2025 professional list · BoomRx from the supplied sheet. Retail multiplier (×2.5) and \$30 shipping are current clinic defaults — if leadership changes them, this guide and the tool are updated together. Questions? Ask a manager before quoting.
